The immune system works hard to defend you from pathogens, including bacteria and viruses. it's made up of leukocytes (white blood cells), proteins, and other tissues, including the lymphatic system. when it's not fighting infection, the lymphatic system is busy draining excess fluid from the body's tissues and removing debris from that fluid. Basic immunology the immune system is the body's natural defence in combating organisms. immunology has developed rapidly over the past decade owing to the Immunology for dummies—a painless review of basic concepts (proceedings) aug 01, 2011. by melissa kennedy, dvm, phd, dacvm. cvc in kansas city proceedings. 1 2. next. the immune system has two arms of defense, nonspecific and specific. as with the immune system in total, there are many elements of the nonspecific arm of the immune response. Introduction to immunology tutorial immune system basics the main players. anything that causes an immune response is called an antigen. an antigen may be harmless, such as grass pollen, or harmful, such as the flu virus. disease-causing antigens are called pathogens. the immune system is designed to protect the body from pathogens. The immune system's job to keep them out or, failing that, to seek out and destroy them. when the immune system hits the wrong target or is crippled, however, it can unleash a torrent of diseases, including allergy, arthritis, or aids. the immune system is amazingly complex. it can recognize and remember millions of different enemies, and it

Immunology for dummies friday, november 14, 2008. adaptive/acquired immunity part 1: adaptive/acquired immunity. as shown in the above flowchart, our immunity can be divided into two categories, namely, innate and adaptive/acquired. so what exactly is immunity? simply put, it is a body's ability to resist a disease.
